

Debunking the Latest Scenario on the Rise of the Pork Taboo

PHILIPPE GUILLAUME

Abstract: A number of studies from Tel Aviv date the rise of the pork taboo in Israel as early as the Iron Age I in order to salvage the notion that the taboo was a reaction to the pork-consuming habits of the hated Philistines. Though neither DNA analysis nor pig bone ratios support this scenario, these studies explain how the abhorrence of Iron Age Israelites for pork was eventually canonised in the Persian era. The present paper challenges the validity of each stage of the proposed scenario, arguing that the Hellenistic-era ethnic differentiation based on pork consumption cannot be pushed as far back as the Iron Age.

Keywords: pigs, pork taboo, Sus, ethnicity, Iron Age Palestine, Neo-Assyrian Empire

Philippe Guillaume, Institut für Bibelwissenschaft, University of Berne, Berne; *philippe.guillaume@gmail.com*

Much has been written about why pigs are not kosher (*Lev* 11:7; *Deut* 14:8). Pigs are supposedly ill adapted to the Judean climate, they are infested with worms, they occupy the same place on the food chain as humans,¹ or they are unsuited to a nomadic life-style which most probably explains why not a single pig is listed besides the thousands of other animals recorded on the Banquet Stele of Aššurnaširpal II.² Other explanations focus on what pigs do not produce. Producing no milk, no wool, no traction and only poor-quality leather, pigs played no role in the ‘Secondary Products Revolution’.³ As this revolution occurred well over two millennia before the rise of the biblical ban, it is clear that humans had other reasons to find pigs useful.

Often cited in theological circles to explain the rise of the pork taboo, Mary Douglas declared the pig carrier of the *odium of multiple pollutions*. *First it pollutes because it defies the classification of ungulates. Second, it pollutes because it eats carrion. Third,*

¹ Harris 1977: 162; Sasson 2010: 70.

² Grayson 1991: 175–76. Foster and Salgues (2006: 290) argue that the absence of pork on the menu is due to the fact that Aššurnaširpal (883–859 BCE) ruled during and after a period of major Aramean presence in Mesopotamia.

³ Sherratt 1981; Poplin 2006; Sasson, Greenfield 2014.

*it pollutes because it is reared by non-Israelites.*⁴ To Douglas' indictment, Nicole Ruane adds another level of pollution: the pig *pollutes because it represents a grotesque form of reproduction offensive to biblical society and thought.*⁵

The quest of causes for the biblical ban continues because in the face of millennia of pork consumption around the globe, the pig has served humans well, and continues to do so. Notions of pollution are a *posteriori* justifications of the biblical taboo but fail to identify the causes for its rise. Biological explanations are no more convincing than symbolic ones.

Pigs are in fact one of the most adaptable species of mammals and thrive under most climates. The main threat for wild pigs is deep snow, conditions that are too rare to threaten them in the Levant.⁶ Pigs thrive in hot climates, even in arid environments such as the south of the Dead Sea, the Egyptian desert, in the Northern Negev and South Jordanian Tawilan.⁷ The availability of water is indeed an important factor, not as is commonly thought for the survival of pigs, but for the type of natural environment which makes pig-husbandry a viable option for humans. As for worms, all mammals host them, including humans. The thriving demography of pork-eating China should be enough to discount the actual effect of pig-related worms to human health.

Political reasons have also been advanced. The pork taboo was thought to have been imposed first by the Egyptian crown to tighten its grip over peasants of peripheral areas whose pork consumption supposedly guaranteed them a level of autonomy which made them unruly.⁸ Pigs, however, never seem to have been bred in a peripheral area such as the Hijaz, but in China pork consumption exists side by side with a strong central government.⁹ As pork-abstaining nomads do not start eating pork once they settle, religion is a major factor in the rise of the pork taboo, though this begs the question as to why would a religion make such a precious source of proteins taboo.¹⁰

ARCHAEOLOGY AT THE RESCUE

MITOCHONDRIAL DNA

Recent research made at the Weizmann Institute of Science in Israel presents new insights regarding the origin of pigs in the Levant. A study of DNA sought to determine whether or not the arrival of European pigs in the Levant could be tied to the migration of the Sea People and the coming of the Philistines.¹¹ The appearance of European pigs in the Levant at about the same time as the Philistines would support the ethnic scenario, according to which the biblical taboo represents the reaction of Israelite population to the arrival

of pork-eating Philistines. The validity of this scenario was disputed in 2002 and the question now is whether or not new data can disprove Brian Hesse and Paula Wapnish's resistance.¹²

The study concludes that European pigs arrived both in Anatolia and in the southern Levant in the Iron Age, though it admits that there is a 250-year gap between the purported coming of the Philistines and the first European mitochondrial DNA signal. The authors of the study also concede that they cannot refute the possibility that European pigs were brought to the southern Levant already in the Bronze Age, because the crucial sample from Middle Bronze Ashkelon could not be radio-carbon dated and may be intrusive. Nevertheless, the publication claims that a major shift between Near Eastern to European haplotypes took place around 900 BCE in the southern Levant. To maintain the connection to the migration of the Sea Peoples, the following qualifications are introduced:

1. the Sea Peoples' migration was a several-decades-long process;
2. most of the Iron Age samples come from non-Sea Peoples sites;
3. the sample-size is too small to track minute chronological processes within the early phases of the Iron Age;
4. it took some time for the haplotype to become significant.¹³

In fact, the several decades of the purported Sea People migration turn out to be a two-century process during which many things happened besides the arrival of the so-called Sea People. That such a study uses the notion of 'Sea People sites' is surprising since the article states that *the distribution of Philistine pottery indicates at least cultural diffusion to broader areas of the region, beyond the coast of the Levant, e.g., to the north and inland of the Levant.*¹⁴ Hence, besides the limited size of the sample, which prevents tracking when in the Iron Age European pigs arrived in the Levant, the study cannot confirm the link between the arrival of European pigs and the Philistines.

The application of hard sciences in the debate is a most welcome move as it introduces data which is less easily manipulated than is the case in social sciences. Impressive as it is, the study of mitochondrial DNA cannot prove or disprove the notion that the biblical pork taboo was a reaction to the arrival of the Philistines in the Levantine coast.

PIG BONES RATIOS

More relevant to the ethnic scenario, another Israeli study financed by the same European grant as the above study, presents a most useful synthesis of data from excavations of the last twenty years.¹⁵ The paper presents the relevant data provided in this study in **Tab. 1**.

¹² Hesse, Wapnish 2002: 469.

Tab 1. Pig bones ratios by region and period

Iron Age	Judah	Urban coastal sites	Rural coastal sites	Lowland Israelite sites	Highland Israelite sites
I	low	high	low	low	low
IIA-B	low	high	?	high	?
IIC	low	drastic decrease	low	?	?
Persian	?	?	?	?	?

Differences in pig bone ratios appear between urban and rural sites in the coastal lowland and between Judahite and Northern Israelite sites in the Iron Age IIB:

- three non-urban settlements within the presumed territory of the Philistine city-states have no or very few pig bones: only 0.4% at Aphek, 1.2% at Tell Qasile in northern Philistia, and no pig bones in Qubur el-Waleyide near Gaza;
- Lowland sites in the presumed Israelite kingdom of the Iron Age IIB have relatively high pig bones ratios: Beth-Shean 7.5%, Megiddo 7.5%, and Yoqneam 5%.

Logically, the discussion of the archaeological data concludes that *correlating pork consumption and avoidance with cultural differentiation processes between the Philistines and the “others”, be they Israelite or Canaanite, is somewhat insecure*.¹⁶ Insecure as it is, abstinence from pork is nevertheless restated as a valid ethnic marker in the concluding paragraph of the article: *Pig taboo could have emerged in the highlands – in the north and in the south where as a result of the pastoral background of many of the Iron Age I settlers and the need to create a “we”-and-“they” boundary with the Philistines in the southern lowlands*.¹⁷

This conclusion is not supported by the data discussed in the study itself. A more obvious conclusion would focus on differences between rural and urban sites as well as between coastal and highland sites rather than maintaining the distinction between Philistines and others, a distinction that the above DNA study could not confirm. What the correlation of pig bone ratios does indicate is that rural sites in Iron Age I Philistia display similar ratios to highland sites of the period. Therefore, the validity of pork consumption as an ethnic marker is seriously undermined. To avoid this conclusion, two of Israel Finkelstein’s hypotheses are recruited to shore up an ethnic cause for the rise of the biblical pork taboo: a population explosion in Iron Age II northern Israel and a flood of Israelite refugees in Judah in the wake of the Assyrian conquests. The scenario for the rise of the pork taboo is reconstructed in four phases:

1. Pork avoidance emerged in the Iron Age I when highland settlers felt the need to create a boundary with the Philistines.
2. In the Iron Age II, Israelites had to start eating pork as the population explosion reduced pasturing grounds to the point that there was not enough space to graze sheep and goat.

¹⁶ Sapir-Hen *et al.* 2013: 11.

¹⁷ Sapir-Hen *et al.* 2013: 13.

3. Upon the collapse of the Northern Kingdom, Israelite refugees fled to Judah where their pork eating habit was frowned upon by Judahite rulers who aspired to rule the territories of the ex-Northern Kingdom. Concern over the pork consumption of the Israelite refugees became more acute when Josiah sought to extend Jerusalem's rule over the territories of the Assyrian province of Samaria.

4. The pork consumption habits of these Israelite refugees remained acute enough in the eyes of Judeans to spur the biblical pork taboo in the Persian era when the pork taboo became a Judahite cultural trait the biblical authors wished to impose on the entire Israelite population.

This impressive reconstruction finds little support in the up-to-date zooarchaeological results gathered by the study itself. Instead, it fills gaps with hypotheses that have been repeatedly discussed by other scholars and found wanting.

The gaps are due to the fact that zooarchaeology is still in its infancy: *The routine collection of animal remains from sites of the Bronze Age and later in the Levant is only a recent development.*¹⁸ As indicated in **Tab. 1**, the study ignores the few (and admittedly quite insignificant) results from Persian era sites.¹⁹ The dearth of Persian era data is a major problem if the pork taboo was committed to writing during Achaemenid rule, as stage 4 argues. Also lacking is data for Iron Age IIB Israelite sites in the highland, precisely when lowland Israelite cities display an increase of pig bones.²⁰ This prevents any comparison between the two sectors of the Kingdom of Israel. For the Iron Age I, the pork-loving trait of the Philistines is only based on pig bone ratios from Gath and Ekron. Most of the data from Ashkelon is forthcoming,²¹ the excavations at Ashdod did not collect enough bones and Gaza is off-limits. Besides the limitations of the archaeological data, several components of the historical reconstruction are disputable. The case requires a detour to consider the notion of ethnicity which underlies the search of a distinct Israelite identity in the Iron Age I.

THE SHAKY PILLARS OF ISRAELITE ETHNOGENESIS IN THE IRON AGE I

If the pig taboo *emerged in the highlands – in the north and in the south – as a result of the pastoral background of many of the Iron Age I settlers,*²² the Philistine factor becomes irrelevant to the rise of the pork taboo, all the more so since lowland rural sites display the same lack of pig bones as highland sites.

Moreover, ‘pastoralism’ is rather vague and in no way explains the rise of the biblical taboo. What rules out pig husbandry is long distance nomadism, a specific kind of nomadism that arose later than the Iron Age I. The short distance seasonal movement of flocks in

¹⁸ Hesse, Wapnish 2002: 460.

¹⁹ Hesse, Wapnish 2002: 489 has six Persian era entries (Yoqneam, Michal, Ashkelon, Jemmeh, Hesi and Halif).

²⁰ Sapir-Hen *et al.* 2013: 11.

²¹ Hesse, Fulton, Wapnish 2011.

²² Sapir-Hen *et al.* 2013: 13.

no way excludes rearing a few pigs around the home because settlements are not empty while the flocks are driven to distant pastures. Moreover, the ethnoarchaeological studies mentioned below reveal that pigs can be herded and driven over tens of kilometres to make the most of resources at different altitudes, exactly what transhumance pastoralism does. Therefore, the pastoral background of Iron Age I highlanders offers no explanation for the rise of the pork taboo.

The repetition of the notion of the rise of the pork taboo at the end of the study that does not support it springs not from analysis of the archaeological data but from the fact that pig bones are the last pillar upon which the existence of an Israelite ethnogenesis as early as the Iron Age I has been constructed. Hence the reluctance to give up pig bones as a valid marker of proto-Israelite ethnicity in the Iron Age I. Instead of drawing the conclusion that pork consumption did not differentiate Iron Age I highlanders from their contemporaries in small (Philistine?) coastal sites, the difference between pig bone ratios from a few Iron Age I lowland cities and the highland is restated to shore up by mere repetition the notion that pork consumption served as an ethnic marker with which proto-Israelites developed a separate identity.²³

The other markers – four-room pillar houses, collared-rim jars and undecorated table ware – by which the highland population of the southern Levant supposedly signified their distinct Israelite identity – have all lost much significance despite the publications that keep repeating them.²⁴ The distribution of four-room pillared houses and of collared-rim jars is far broader than the area occupied by ancient Israel (see below).

To salvage the validity of the four-room house, variations from the normative model are deemed local adaptations when they are found in what is considered Israelite territory, while they are rejected as not fitting the model when they do not deviate from the model but are found outside what is considered Israelite territory. Neither *the number of rooms nor the presence of pillars are sufficient indicators*, or they indicate the presence of Israelites in Transjordan.²⁵

Another way to deal with four-room houses outside Israelite territory is to consider them irrelevant since most of them date to the Iron Age I, that is *earlier than the final crystallization of ethnic groups in the land*.²⁶ If the final crystallisation of Israelite ethnicity only occurred in the Iron Age II, the discussion of the other Philistine and Israelite ethnic markers in the Iron Age is irrelevant and the four-room house cannot be a marker of Israelite ethnicity before the end of the Iron Age I.

Therefore, pig bones ratios are now the last crutch to hold up the notion of Israelite ethnicity in the Iron Age I. The difference in the proportion of pig bones in faunal assemblages is declared the consequence of the hostile interaction between ‘Philistines’ and proto-Israelites: *As the interaction between the groups intensified, they needed to stress*

²³ Finkelstein 1988; 1997.

²⁴ Stager 1995; Faust 2007; 2012; Joffe 1999.

²⁵ Faust, Bunimovitz 2003: 30.

²⁶ Faust, Bunimovitz 2003: 30.

and demarcate the differences between them, and as the process of boundary maintenance intensified, each group stressed the habits that were different from those of the other group.²⁷

Yet, a study published a year later by the same zooarchaeologist warns that the pork consumption criterion remains based on *small sample sizes and only scant consideration of possible alternatives which may explain the perceived phenomenon.*²⁸ As this opinion agrees with the view that the correlation of pork consumption with cultural differentiation processes between the Philistines and others is insecure,²⁹ the pillar shoring up a distinctive Israelite identity as early as the Iron Age I is about to collapse. The reappearance of pig bone ratios as a valid ethnic marker in the conclusion of the article that deems them insecure compensates the lack of evidence by sheer repetition.³⁰

Turning from archaeology to history, any discussion of the history of the kingdoms of the southern Levant has to start with the campaigns of Pharaoh Shoshenq.³¹ Before Shoshenq's journey in the southern Levant, the lack of sources prevents drawing a coherent picture of the relation between the various kingdoms of the region, and even more so whether some inhabitants hated pork because their neighbours loved ham.³² In fact, the biblical Philistines may well reflect seventh century BCE realities.³³

To be sure, hints to realities earlier than the seventh century and even earlier than Shoshenq may still be found in the biblical text. The *Book of Samuel* reports Philistine garrisons in the highland, well beyond the geographic distribution of Philistine pottery: in Bethlehem (2 Sam 23:14), Gibeon (1 Sam 10:5; cf. 2 Sam 21:2) and possibly in Jerusalem (2 Sam 5:6-9.18–25).³⁴ If high pig bone ratios are accepted as markers of Philistine identity resulting from the Aegean origins of the Philistines, terms of possible Aegean origin used in descriptions of the temple of Jerusalem such as לְבִיר and לשכה can be taken as reflections of 'Philistine' influence too. Tellingly, these terms are not deemed foreign in the Hebrew Bible.³⁵ Hence, there is no evidence of animosity between highland and lowland groups before Shoshenq, nor between the kingdoms of Judah and Gath in the tenth–ninth centuries BCE.³⁶ In this case, the competition between Philistines and Judeans is built on sand. The verdict published ten years ago remains valid: *the search for Israel's ancient ethnic identity is a strange one, since it almost always seems to presuppose an anachronistic form of national identity, assuming not only the congruence of a political territorial Israel and a communal social Israel, but also the persistence of such a congruence,*

*an impossibility—to say nothing of the assumption of shared political identity between ruler and ruled.*³⁷

Continuing to promote pork consumption as an ethnic marker of Philistine culture is perilous.³⁸ No help can be expected from biblical texts that are mute as to whether or not Israelites considered house plans, storage jars and table ware meaningful cultural traits.³⁹ The texts only mention abstinence from pork, but not in relation to the Philistines who are designated as uncircumcised, never as pork-eaters. Circumcision is of course beyond archaeological scrutiny.

ETHNICITY AS AN IMPERIAL PHENOMENON

Another problem with the search for a specific Israelite or Judean ethnicity as early as the Iron Age I is that ethnicity seems to be a consequence of some forms of imperialism.⁴⁰ Unless ethnicity is used as a ragbag for anything having to do with identity, ‘ethnicity’ ought to be reserved for *social relationships structured around differences that are based on and communicated by commonly accepted markers of such differentiation.*⁴¹ One important marker is common descent, not actual biological descent but a socially constructed discourse of such descent.⁴² Related to descent are a shared past and a homeland associated with the group, though this does not imply political control of that territory.⁴³

The low demographic levels in the Iron Age I are unlikely conditions for the rise of tensions between the highlanders and their coastal neighbours. If the biblical portrayal of the Philistines reflects seven-century realities,⁴⁴ a distinctive Israelite ethnicity arose in reaction to Neo-Assyrian imperialism involving *large-scale social, demographic and economic changes for people on both sides. Ethnic identification offers a way of maintaining continuity in the face of such fundamental changes.*⁴⁵ Hence, *it would be unsurprising to observe the advent of Assyrian influence provoking ethnic identity formation processes in parts of the southern Levant.*⁴⁶ Moreover, similarities shared by the groups that seek to distinguish themselves are as crucial as their differences: *ethnic formation phenomena are most likely to occur in situations in which the groups on either side of the boundary are, in significant number of respects, very similar... the confrontation of minor differences in the context of overall similarity poses a greater challenge than the broad strokes of total difference.*⁴⁷

⁴⁷ Crouch 2014: 95 quoting Harrison 1999; 2003.

Besides greater mobility, contact and interchange generated by long distance trade, the large scale deportations initiated by the Neo-Assyrian Empire made homeland and common descent powerful categories.⁴⁸

Stricto sensu ethnicity is a Hellenistic notion, at a time when *ethnos* became a tool of imperial rule. The rise of significant ethnic markers could nevertheless have started already with the cultural flux of the Neo-Assyrian era, hardly any earlier. As nativism is a reaction to internationalism, the aspiration of Neo-Assyrian rulers to ‘turn into Assyrians’ every group living within the confines of the empire gave rise to proto-ethnicities.⁴⁹ Therefore, it is highly unlikely that pork consumption or pork avoidance was a significant marker of identity in the Levant before the seventh century BCE.⁵⁰

PORK COMPENSATING GRAZING GROUNDS SHRINKAGE IN THE IRON AGE II?

Pig husbandry has been viewed as the strategic response to the lack of hinterland of the Philistine urban ‘city-villages’.⁵¹ This notion is then applied to the Israelite lowland sites. In the Jezreel Valley, the demographic explosion of the Iron Age II combined with a slightly dryer climate supposedly led to a shift in meat production. Overgrazing forced farmers to reduce the size of flocks and compensate the loss of mutton with pork from sty-fed pigs.⁵² There are major problems here.

DEMOGRAPHIC EXPLOSION AND GRAZING GROUNDS SHRINKAGE?

The idea that the population explosion of the Iron Age II, significant as this explosion was compared to earlier demographic levels, impacted the availability of grazing grounds, is dubious. In the western Jezreel Valley, the increase of the number of sites is estimated from 46 to 66 with a total built-up surface from 57 to 72 hectares between the Iron Age I and the peak in the Iron Age II. The increase in the Samarian highland is more significant: from 80 sites in the Iron Age I to 240 sites in the Iron Age II.⁵³ These figures remain modest compared to the size of the regions in question: 450km² for the western Jezreel Valley and 1,800km² for the Samarian region.⁵⁴

These figures derive from the collection of surface sherds, sometimes from only a portion of sites when the rest was covered by thick vegetation or inhabited by Palestinians. Hence, site surface estimates are very approximative and even more so the population levels based on them since population density can vary enormously from site to site.⁵⁵

⁴⁸ Antonaccio 2010: 46.

⁴⁹ Fales 2013.

⁵⁰ Niesiolowski-Spanò 2015.

⁵¹ Shavit 2008: 158–159.

⁵² Sapir-Hen *et al.* 2013: 13.

⁵³ Finkelstein *et al.* 2006: 760.

⁵⁴ Finkelstein *et al.* 2006: 705.

⁵⁵ Leibner 2014.

For what they are worth, these figures can be compared with estimates of land use in prehistoric Europe. A typical 30-person settlement would have covered 4.5ha for houses, outbuildings and gardens. It would have needed 13.2ha of wheat and 57ha of woodland for fuel and timber. Its 40 heads of cattle and 40 heads of caprovids would have needed about 40ha of pasture land plus 2.56km² of forest browse.⁵⁶

The 72ha of built-up surface in Iron Age II western Jezreel Valley correspond to sixteen European prehistoric settlements ($16 \times 4.5\text{ha} = 72\text{ha}$). In this case, at the population peak during the Iron Age II, the inhabitants of the western Jezreel Valley would have needed 211.2ha ($13.2 \times 16\text{ha}$) of wheat and 912ha ($57 \times 16\text{ha}$) of woodland for fuel and timber. Their livestock would have needed about 640ha ($16 \times 40\text{ha}$) of pasture and 40.96km² ($16 \times 2.56\text{km}^2$) of forest browse, altogether 58.6km² ($211.2\text{ha} + 912\text{ha} + 640\text{ha} + 41\text{km}^2$). As the western Jezreel Valley covers 450km², its population could have been multiplied by a factor of eight before its carrying capacity would have been reached.

Obviously, prehistoric Europe is not the Iron Age Jezreel Valley. The bone repertoires in the Levant hold a much larger amount of caprovids and less bovines than Susan Gregg's estimate that count an equal number of heads of both types. Moreover, fuel requirements are likely to be lower in the Jezreel Valley than in Europe. Though all these figures are very approximate estimates, the comparison indicates that the notion of land shortage in the Iron Age II is suspect and can hardly explain the rise of pig bone ratios in the Jezreel Valley.

PORK CONSUMPTION AND LOW ECONOMIC STATUS?

A second issue concerns the most interesting result of the study: the sharp difference of the amount of pig bones between urban and rural 'Philistine' sites. The rural-urban dichotomy is problematic for Iron Age I Palestine,⁵⁷ but for the present discussion it may be taken as valid. More problematic is the notion that *larger numbers of pigs are correlated with lower economic status*.⁵⁸

The correlation between pig breeding and low social strata is based on the idea that the *swine would not be a favored resource in complex, often centrally coordinated urban economies in the Ancient Near East*.⁵⁹ What evidence is there for such a claim?

A social stigma was indeed attached to pork consumption in Egypt in the sixteenth century BCE when pork was viewed as characteristic of a poor man's diet, but the amount of pig bones in the wealthy urban centres in Egypt and in the Levant counters the notion that a similar view existed in the Iron Age.⁶⁰ Despite the claim that Egyptians considered pigs unclean (*Herodotus* II.47), Egyptians raised pigs and ate them.⁶¹ The sacrifice of pigs

⁵⁶ Gregg 1988: 165–167.

⁵⁷ Guillaume 2016.

⁵⁸ Sapir-Hen *et al.* 2013: 11.

⁵⁹ Zeder 1996: 308.

⁶⁰ Redding 1991; Lobban 1998.

⁶¹ Clarysse, Thompson 2006: 208–217.

is well attested in Egypt and the consumption of pork was only restricted for priests.⁶² In this case, the notion that larger numbers of pigs are correlated with lower economic status may be valid for Egypt.

In Mesopotamia, hemerologies deem the consumption of pork dangerous only at certain times: on 27 VII along with beef (*Babylonian Almanac*), alone on 28 VII (*Offering Bread Hemerology*), and together with leek, cress, beef and grilled meats in general. The *Hemerology for Nazimaruttaš* adds pork and dates on 5 VIII. The consumption of pork together with beef and grilled meats on 4 VII is deemed dangerous by the *Original of Akkad*.⁶³ The concentration of the prohibition of pork, and often of beef as well, on month seven reflects the general view of the seventh month as unfavourable, though it is mostly its first seven days that are ‘numinously evil’.⁶⁴ The absence of pork on the menu of Aššurnaširpal’s banquet⁶⁵ could find an explanation if the banquet occurred on the days when pork alone was deemed dangerous. In any case, pork consumption and abstinence in Mesopotamia is more a matter of calendar than of economic status.

In the Levant, the highest pig bone ratios in urban centres both on the coast (Iron Age I) and in the Jezreel Valley (Iron Age IIA-B) occur during prosperous times.⁶⁶ High pig bone ratios are also a reflection of urbanisation, an explanation that applies as much to Iron Age I coastal centres as to the Jezreel Valley in the Iron Age II. The difference in pig bone ratios reflects the difference between rural and urban conditions, urbanisation being as a rule more advanced in coastal lowlands than in the highland. As urban lowland settlements typically display higher material repertoires than rural highland settlements, pig bone ratios are highest in lowland urban settlements thanks to the higher economic status of lowland urbanites. Therefore, the correlation of high pig bone ratios with prosperous urban centres is hard to reconcile with the claim that *larger numbers of pigs are correlated with lower economic status*.⁶⁷ To do so one would have to argue that elites resided in rural sites with low pig bone ratios, or that pig bones in urban sites were only recovered from quarters inhabited by the populace. The notion that elites avoided pork can hardly explain the rise of the pork taboo.

STALLED PIGS IN CRAMPED ISRAELITE VALLEYS?

To support the claim that pig husbandry was the solution to overpopulation and the subsequent shortage of grazing land in Israelite lowland sites, Lidar Sapir-Hen and others⁶⁸ explain that pigs *do not need to be driven to pasture when there is enough available food*,

⁶² Volokhine 2014: 169–211; el-Huseny 2006.

⁶³ Livingstone 2013: 264–265.

⁶⁷ Sapir-Hen *et al.* 2013: 11.

⁶⁸ Sapir-Hen *et al.* 2013: 2.

*such as vegetables and animal waste.*⁶⁹ Where on earth did such a surplus of vegetables and animal waste come from if the valleys were overpopulated and overgrazed to the point that flocks and herds had to be reduced?

As argued above, pig husbandry reflects favourable economic conditions and it is only in this sense that the greater availability of food surpluses in urban settlements made pig husbandry within urban settlements economically viable. Yet, for pigs to thrive on vegetables, Iron Age II farmers would have had to revert to intensive market gardening. As for the animal wastes, what could they be? Whey-milk from a thriving dairy industry comes to mind, but it is unlikely if grazing land for sheep and goats, never mind cows, was in short supply.

Only the concentration of refuse from proto-industrial operations (bakeries, silo bottoms, olive pressings) within urban centres would have made feeding stalled pigs economically viable.⁷⁰ Yet, this remained marginal throughout the Iron Age as the number of pig bones is rarely above 10% of the total animal bone repertoire.

Pigs may indeed have been raised in sties centuries earlier at Tell el-Amarna, another royal capital towards which food surplus converged.⁷¹ The case of Amarna thus supports the notion that sty-bred pigs occurred only in certain central sites where pigs recycled urban refuses. Apart from these rare sites, pork could not replace mutton until the advent of modern agro-industrial operations. In the Iron Age, solving problems resulting from overpopulation with pork makes no sense whatsoever.

Apart from the stalled pigs in urban centres, most pigs across the world were raised in a free range manner.⁷² The advent of intensive piggeries in the twentieth century CE led to the termination of traditional methods, except in marginal areas. Modern pigs, except in luxury bio-farms, are now raised indoors, where they are fed a mixture of dairy and milling industry by-products (whey-milk, cereals and soy). As late as World War II, pigs in rural southern France were still being driven off in the morning beyond the cultivated belt around villages. Pigs spent the day as a group foraging in the woods for acorns, beech-masts, chestnuts, grubs, fruits, roots, mice, insects, snails, mushrooms, and worms. In the evening, a small amount of kitchen refuse was enough to entice the pigs to return to their respective owners' homes. The economic justification of breeding pigs was based on their ability to feed themselves in and beyond the settlements.⁷³ Although he states that *pigs can make shift in any sort of country wherever situated*,⁷⁴ Columella (7.9.6) adds that the most convenient feeding-grounds for pigs are woods covered with various kinds of oaks, nut and wild fruit trees. The same was true in Medieval England where it was designated

as pannage.⁷⁵ This was probably true in third millennium BCE Mesopotamia where pig bone ratios seem to follow the climatic variations: they rise when greater humidity favours forestation and decline when dryer conditions led to deforestation.⁷⁶

Free range pig husbandry survives in Sardinia where breeders report that they might not see their pigs for an entire month when there is enough food in the woods. The animals usually remain within a ten kilometer radius of the farm and eventually come back to the sty. The exception is uncastrated boars that may sometimes be lost.⁷⁷ In Corsica, a form of transhumance is still practised. The *cochons courreurs* are taken to the highlands in the summer where they are left to feed themselves.

With or without transhumance, open range breeding involves far less human supervision than is the case with sheep and goats. Pigs only have predators when the human demography is small enough to enable the development of large predators such as lions and bears.⁷⁸ Otherwise, only newborn piglets are at risk from foxes and large birds of prey.⁷⁹ Ancient pigs constantly navigated between the domestic and wild spheres, a fact that blurs the line between breeding and hunting: *Zooarchaeologists may sometimes be too keen to make a clear distinction between the management of domestic and wild resources. This hardly seems to be applicable to all areas and situations. In Sardinia and Corsica not only is there a biological continuum between the two Sus forms, but also husbandry practices are geared towards a combined management of wild boar and domestic pigs, whose interbreeding is in some cases regarded as an opportunity, but more often as a nuisance... Our study of modern Sardinian and Corsican pig husbandry indicates that the emphasis in our explanations must be on management rather than biological status, as the second is by and large the product of the first.*⁸⁰

The emphasis on management rather than on biological status reduces the relevance of DNA studies for the understanding of the biblical pork taboo as free range pig husbandry affords plenty of opportunity for the occasional domesticated pigs to go feral and for domestic sows to be fertilised by wild boars, themselves likely descendants of domestic pigs that went feral.⁸¹ The hybridisation between wild and domestic pigs goes both ways to the point that genetically and phenotypically they are hard to distinguish. Hybridisation can even be a conscious breeding strategy to save on the expenses of keeping boars and the inherent danger mature uncastrated boars represent to humans.⁸² Every male piglet can be culled or castrated when wild boars can be relied upon to inseminate domestic sows. The suidae, then, represent a particular case where the distance between domestic and wild strands is very small. This unique phenomenon is reflected in Babylonian lexical

texts where lexicographers found it difficult to classify pigs and listed different categories of pigs between domesticated and wild animals.⁸³

The usefulness of the biometrical differences used to distinguish between wild and domesticated suidae in zooarchaeological studies is equally doubtful. This criterion is heavily dependent on comparison with modern breeds and its application can only provide tentative distinctions.⁸⁴

Mortality profiles and the dominance of bones of juveniles bearing butchering marks, other criteria used to determine domestic status, are even more problematic in light of the small samples currently available. Thanks to their smaller size, younger wild pigs were more likely to be caught by hunters and brought back home than larger adult specimen that are far more dangerous to hunt and heavier to carry back to the settlement. The criteria of size and mortality profile thus interfere as much as they complement one another.⁸⁵ If pig bones with butchering marks reveal pork consumption, they do not reveal economic specialization. 10% of pig bones in any bone assemblage can hardly be taken as the indication of economic specialisation in pig husbandry.

The slightly higher ratios of pig bones in urban centres than in rural sites results from the greater availability of food surpluses, grain and olive pressings. Within the walls of Bronze Age Ugarit one olive oil workshop is counted to every ten houses.⁸⁶ Hence, in the urban economies of the ancient Levant swine would recycle the refuse produced by oil presses and the remains from the large grain storage facilities that characterise the economic function of urban centres. Far from holding the same place as humans on the food chain, pigs made the most of what humans did not eat: urban refuse and products of the wild.

Nevertheless, urban stalled pigs as much as free range husbandry remained marginal even in the Roman world where the leaner, long-legged, wild-boar-like breed remained most prevalent, for the simple reason that it was better adapted for foraging in the woods and for herding on the hoof to markets.⁸⁷ In the Levant and in Greece, cheap cereal feed only became available in the second part of the twentieth century.⁸⁸ This belies the notion that enough food was available in ancient Levantine villages to feed stalled pigs. Apart from Roman bakers, olive oil pressers from Ekron (even though the percentage of pig bones in the recovered assemblage of the Iron Age II is significantly smaller than that of the Iron Age I) and the managers of the Megiddo silo, ancient Levantine farmers relied on the ability of pigs to feed themselves in the wild, a view which finds some support from the Hebrew Bible.

FREE RANGE PIG HUSBANDRY IN THE HEBREW BIBLE

The irrelevance of the wild/domestic distinction when discussing pigs is reflected in biblical Hebrew and other Semitic vocabulary, which use the same word for domestic pigs and wild boars.⁸⁹ The lack of differentiation in the vocabulary reflects the lack of phenotypical differences in ancient domesticated and wild pigs that shared similar coat colours and other morphological characteristics.⁹⁰ Hence, *Ps* 80:14 mentions a pig of the forest (חַזֵּיר מִיעָר) to designate a wild pig. A metaphor in *Prov* 11:22 confirms the existence of free range pigs in ancient Israel: נָזֵם זָהָב בְּאֶחָד חַזֵּיר אֲשֶׁר יִפְהַרְתָּ טֻמָּה, *A golden ring in a pig's nose (is) a beautiful woman without discernment.* Hence, free range pig husbandry was common knowledge in ancient Israel and Judah. This in itself does not prove that Israelites and Judeans ate pork, but it indicates some familiarity with domestic pigs and how to deal with them.

ISRAELITE REFUGEES IN JUDAH AFTER 720 BCE?

To bridge the gap between the pork-eating Israelites of the Iron Age II and the completion of the Torah in the Persian period, a flood of Israelite refugees into Judah around 720 BCE is postulated. This flood supposedly explains how the pork taboo reached Jerusalem and became entrenched there to the point that it was recorded in the Torah. As this flood has been repeatedly refuted there is no need to repeat the arguments that militate against it.⁹¹ It is enough to doubt the link between Hezekiah or Josiah's desire to rule from Dan to Beer-sheba and even more the 'continuing concern regarding pigs' in Judah after the withdrawal of the Assyrians from the Levant.⁹²

Tellingly, the argument of a specialisation on pig husbandry evoked as a strategy in crowded northern Israel is not applied to Judah when it was supposedly flooded by Israelite refugees. If the demographic explosion in Iron Age II Israel led to shift meat production towards pork, nothing of the sort happened in Judah: *Judah too features dramatic population growth in the Iron Age IIB; still, in the Iron Age IIB, as in earlier periods, the population of Judah was much smaller than that of Israel and hence there could have been enough open-spaces, especially in the Sheffelah.*⁹³

If pork abstinence indeed existed as an Israelite and Judean cultural trait as far back as the Iron Age I and that it was only under economic duress that Israelites started eating pork in order to survive in their overcrowded valleys, why, once settled in less populated Judah, did the Israelite refugees continue raising pigs when more space was available, despite their flooding of Judah?

The scenario needs the Israelites to remain hooked on pork, both those Israelites who flooded Judah and those who remained in depopulated Israel after the collapse of the

Northern Kingdom. Otherwise, their pork eating habits could not become an issue for their Judahite hosts and for King Josiah who supposedly sought to rule over the territories of the Assyrian province of Samaria. Not only the Israelites did not revert to the pork abstinence of their Iron Age I ancestors in the days of Josiah, but they remained hooked on pork for centuries till the Achaemenid era when their pork consumption habits remained acute enough in the eyes of Judahite writers of the Torah who wished to impose the biblical pork taboo on the entire population.

In fact, there is no indication for any Judean concern regarding pork consumption habits in northern Israelite territories. According to the biblical text, Josiah destroyed cultic paraphernalia at Bethel, desecrated tombs and burnt human bones on the altar there (2 Kgs 23:15–16). Hence, the link between Judahite concerns regarding Israelite pigs after the Assyrian withdrawal and the biblical taboo is strained. What remains is the parallelism between pork consumption in urban centres, whether Philistine or Israelite. The significance of this fact surfaces all-the-more clearly once Melinda Zeder's axiom is overturned and that pork consumption is viewed as a mark of higher economic conditions in urban centres. The straight-forward interpretation of the data (see **Tab. 1** above) is that pig bone ratios rise with economic conditions until the second part of the first millennium BCE. The correlation applies to thriving urban sites both in Philistia and in Israel.

CONCLUSION

As the Torah was considered authoritative in the Ptolemaic era, the biblical taboo was formulated in the Persian era at the latest. The circumstances in which the biblical taboo emerged have to be reconstructed from the ecological and economic factors that prevailed then.

A first notion to reject is that since pigs love woodland *there would be no pigs or wild boars in the deforested mountains of Palestine*.⁹⁴ In fact, wild pigs and gazelles are identified as the two wild species that are the least affected by deforestation.⁹⁵ The increase of pig bones detected in lowland sites considered under Israelite rule in the Iron Age II (Yoqneam, Rehov and Hazor) shows that the relative deforestation following the population explosion of the Iron Age II in no way eradicated pigs. The consumption of pork increased, obtained either from free range pigs, from hunted wild boars or both. The extension of ploughed fields and olive groves at the expense of oaks and caroub trees was not significant enough to reduce the amount of acorns and other pig food to the point that free range pig husbandry became uneconomical.⁹⁶ What about the Persian era?

The reforestation that followed the depopulation of Yehud after the Babylonian destructions seriously reduced the number of pork eaters while increasing the amount of pig food available in the forest. In depopulated Yehud wild pigs, gazelles and wild birds were an abundant source of meat. Plentiful game reduced the incentive to raise pigs. The presence

⁹⁴ Lemche 2010: 100.

⁹⁵ Tsahar *et al.* 2009.

⁹⁶ Liphshitz 2007: 48–49; 2008.

of bears, leopards and other such predators in the woods and thickets between settlements would have further reduced the incentive to raise free range pigs.

The grand reconstruction proposed by our Tel Aviv colleagues hardly advances our understanding of the rise of the biblical taboo. The Hellenistic melting-pot did spur the need for ‘we’-and-‘they’ boundaries with close neighbours. Pushing this need as far back as the Iron Age I has no archaeological or historical support whatsoever. Therefore, Brian Hesse and Paula Wapnish’s reluctance to accept this scenario should be reaffirmed until more convincing arguments are presented.
